: This section displays the app's various scores, such as the average CVSS, security score, and number of trackers recognized.
: Each app is given a perfect score of 100. For each finding with a high severity, MobSF subtracts 15 points from the score. MobSF deducts ten points for each finding with a severity warning and adds 5 to the score for each finding with a good severity. As long as the calculated score is higher than 100, the app security score is considered 100. And if the estimated value is less than 0, then the app security score is evaluated as 10.

: Dynamic analysis is the process of testing and analyzing a program while it is executing. Dynamic analysis, also known as dynamic code scanning, aids in the detection and correction of errors, memory issues, and other issues with program execution. Before moving on to dynamic analysis, static analysis is required.

:
: TLS/SSL Security test allows you to assess the network security of your application. These tests are only applicable to applications that connect to the internet using the HTTP protocol.
:
: #### TLS Misconfiguration Test - Enable HTTPS MITM Proxy, Remove Root CA, Run the App for 25 seconds.
:
: This test will uncover insecure configurations that allow HTTPS connections bypassing certificate errors or SSL/TLS errors in WebViews. This is equivalent to not having TLS.
:
: #### TLS Pinning/Certificate Transparency Test - Enable HTTPS MITM Proxy, Install Root CA, Run the App for 25 seconds.
:

: This test will evaluate the application's TLS/SSL hardening controls and will check if the application implement certificate or public key pinning and or certificate transparency.
:
: #### TLS Pinning/Certificate Transparency Bypass Test - Enable HTTPS MITM Proxy, Install Root CA, Bypass Certificate/Public Key Pinning or Certificate Transparency.
:
: This test tries to bypass certificate or public key pinning and or certificate transparency controls in your application. MobSF can bypass most of the generic implementations.
: ![Tls ssl](https://user-images.githubusercontent.com/37651620/156868868-fbef9cd0-a08c-444c-a0d0-60031c686c1e.png)

: At the moment, MobSF is unable to do autonomous dynamic analysis. This is due to MobSF's lack of understanding of your app's business logic, how to fill in the login and password fields, or what data it should offer. You must manually walk through the application's different business logic and obstacles to get the most out of MobSF dynamic analysis, while MobSF does security analysis on these issues in the background.
